

ABSTRACT

1 An electrical connector for connecting at least two
2 angled conductors together. The electrical connector
3 includes a first section and a second section. The first
4 section has a first conductor receiving channel with a
5 first channel axis. The second section has a second
6 conductor receiving channel with a second channel axis
7 angled relative to the first channel axis. The first and
8 second sections are comprised of a single extruded metal
9 member which has been formed to angle the first and
10 second channel axes relative to each other.
